The compliance bridge that makes RWAs DeFi-composable

$30B of tokenized real-world assets sit on-chain, but only ~8% can move in DeFi — locked behind KYC allowlists and transfer agents. Passage puts compliance inside the token itself, so RWAs can finally be swapped, lent, and used as collateral while every holder stays verified.

$30B	~8%	5	21/21
RWAs tokenized on-chain today	actually circulates in DeFi	Solana programs, live on devnet	integration tests passing

Deposit a permissioned RWA → receive a pToken 1:1 (Token-2022 + transfer hook) → every transfer verifies the recipient on-chain → freely composable, always compliant

WHY PASSAGE WINS

- → **Compliance travels with the asset,** not the venue — protocols stay open, assets stay compliant.
- → **Neutral infrastructure:** one layer for every issuer (Ondo, Centrifuge, Maple) and every DeFi venue — we make their assets more valuable.
- → **Working product:** vault, identity registry, transfer hook and a gated AMM — open source, live on devnet.
- → **Recurring revenue, not just flow:** 5-10 bps/year on wrapped AUM, plus 0.10% wrap/unwrap and venue integrations. No emissions, no ponzinomics.
- → **Regulator-ready:** on-chain KYC audit trail on every transfer; MiCA legal structuring budgeted before mainnet.

REVENUE MODEL

LINE	RATE
Wrapped AUM (recurring)	5-10 bps / yr
Wrap / unwrap	0.10% each way
Venue integration	per venue / yr
Gated AMM swap share	~4 of 25 bps

Ondo charges **15 bps/yr** for tokenization and compliance, on top of BlackRock's 20 bps. At **$2B wrapped**, 8 bps is ~$1.6M a year, recurring — a quarter of what a holder already pays, for a token that becomes usable across DeFi. Our customer is the issuer, not the trader.

OPERATING BUDGET (PRE-APPROVED)

MONTHLY	USD
Founder	16,000
Second developer	10,000
Advisors (2x, part-time: legal/MiCA + issuer relations)	10,000
Marketing & community	8,000
Infrastructure & tooling	1,500
KYC provider	1,000
Entity, accounting, admin	1,500
Contingency	2,000
Total	**~50,000/mo**

One-time: audit $40k · legal/MiCA $60k · entity $15k · listings & integrations $30k · bug bounty $20k ≈ **$165k**
The math: 18 mo × $50k + $165k ≈ $1.07M. A $1.8M raise leaves $1.44M treasury after liquidity — a ~$375k buffer.

ROADMAP

Now	MVP on devnet · open source · community build-up
Q+1	Audit · mainnet · first issuer asset · MetaDAO ICO
Q+2	KYC provider live · 2-3 assets · pToken/USDC pools
Q+3/4	Lending collateral · $5M+ TVW · zk-credentials

$PASS TOKENOMICS

- → **10M supply,** high float — distributed via MetaDAO ICO, no VC allocations, no hidden deals.
- → **Raise:** min $1.8M, capped at $4M. Oversubscription refunded pro-rata in USDC.
- → **Claim on the treasury:** the raise stays on-chain; holders can vote it back if confidence drops.
- → **Staking is a job:** stakers underwrite the credential registry and are slashed if it fails — that backstop is what lets an issuer trust it. They earn half of protocol revenue.
- → **Buyback-and-burn:** the other half. Automatic, permissionless, and continuous rather than lumpy.
- → **Team:** milestone USDC from treasury (capped $1M); 10% performance tokens at 2x/4x/8x, 18-month vesting. Zero sell pressure.
